{{COMPANY_NAME}}

Re: Application for {{ROLE_TITLE}}

Dear {{HIRING_MANAGER}},

I am applying for the {{ROLE_TITLE}} role at {{COMPANY_NAME}}. I build backend systems that stay in production — APIs, auth, payments — and I have already shipped applied LLM features, not just tutorials. I am targeting Backend Engineer / Backend Engineer (AI) work where that mix is the job.

I moved from mechanical engineering into software through a full-stack program at Guvi (IITM Research Park) and have been shipping production systems since late 2023. I started Airtribe's AI-First Backend Engineer program in November 2025 and was promoted to Software Engineer at Four Pillars Infotech in December 2025. From February 2026 I have led a small engineering team on a client engagement. Since then I have been a core contributor on legacy conversion to React and Node, NAD DigiLocker integration, n8n backup-management flows, application security and admin, and an internal project-management product on Node.js, Express, and MongoDB. It includes Razorpay checkout with HMAC-verified webhooks, JWT/httpOnly-cookie auth, and OpenRouter-powered flows — AI task generation, chat summarization and task extraction, an in-thread assistant, and suggest-only bug triage — with deterministic fallbacks so a model failure never takes down the API. That is the proof I would walk through in an interview.

Before the promotion I was an Associate Software Engineer from June 2024. In that period I migrated five legacy PHP modules to Node.js and Django and contributed to a Django admin dashboard with RBAC and analytics on government-facing portals.

I am interested in {{COMPANY_NAME}} because {{WHY_THIS_COMPANY}}. The {{ROLE_TITLE}} role matches how I already work: backend ownership, production reliability, and LLM features that are productized rather than bolted on.

I would welcome a conversation. I can share a 1-page or 2-page resume and walk through the project-management API end to end. Notice period: {{TODO}}.

Sincerely,

Nishant Phule
